Intelicode 14.0.2.1 "Standard" version update with SQL Server database
2016 ICD-10 codes included

The "Standard" version of Intelicode installs to the currently logged on user profile.

Intelicode recommends assuring your company policy is adhered to concerning application updates and downloads. Please consult with your IT/IS department as they should be involved in updating databases on the SQL Server.

Network/DB Admin coordination is required to update SQL Server databases prior to installing the Intelicode update on any computers. The application will fail to function correctly until the SQL Server database is updated.

Files to download for version 14.0.2.1 Standard version update:

SQL Server scripts:

- o ***SQL Server 2008 or newer is required.** (SQL Server 2005 is not supported)*

- o *Provided_v60.3 SQL Script for the "Provided" database: Provided_v60.3.zip*

Application update for the client PC:

- • *Choose either the 32 bit or 64 bit version to download*

  - o *Intelicode 14.0.2.1 Setup (32 bit version): Intelicode_14.0.2.1_Setup.exe*

  - o *Intelicode 14.0.2.1 x64 Setup (64 bit version): Intelicode_14.0.2.1_x64_Setup.exe*

Recommended update steps

- *Download 14.0.2.1 required update files (listed above). Only one of the application Setup files will be used. Choose either the 32 bit version or 64 bit version.*

- *Have all users exit Intelicode.*

SQL Server - update steps

- *MAKE BACKUPS of your SQL Server databases ("Office" and "Provided").*

- *Extract the downloaded script from 'Provided_vXX.X.zip' and execute it against your SQL Server "Provided" database. Note: The name in the [USE] command may need to be modified to indicate the correct name for your "Provided" database. Note: This script may need to be run from a command prompt if memory errors result when executing in Management Studio. Info here for running from command prompt : Large_SQL_Script.pdf*

- *Verify that Intelicode users have db_owner permissions to the "Office" database during the initial connection to allow table changes. Once the initial connection is complete from the updated app, permissions can be set as datareader and datawriter for the Office database if desired. The "Provided" database requires only datareader and datawriter permissions for users.*

Intelicode application - update steps

- *Run the preferred 32 bit or 64 bit Setup.exe on one user computer. Note: Intelicode_14.x.x.x_(x64)_Setup.exe (Standard version update) installs to the profile of the currently logged on user.*

- *Launch Intelicode to let it connect to the SQL Server. Progress bars may be displayed during the initial connection as updates are made to the Office database.*

- *Once the program has completed loading, login and verify the "Office" data is correct.*

- *Proceed to install the same Setup.exe file for all other users.*
